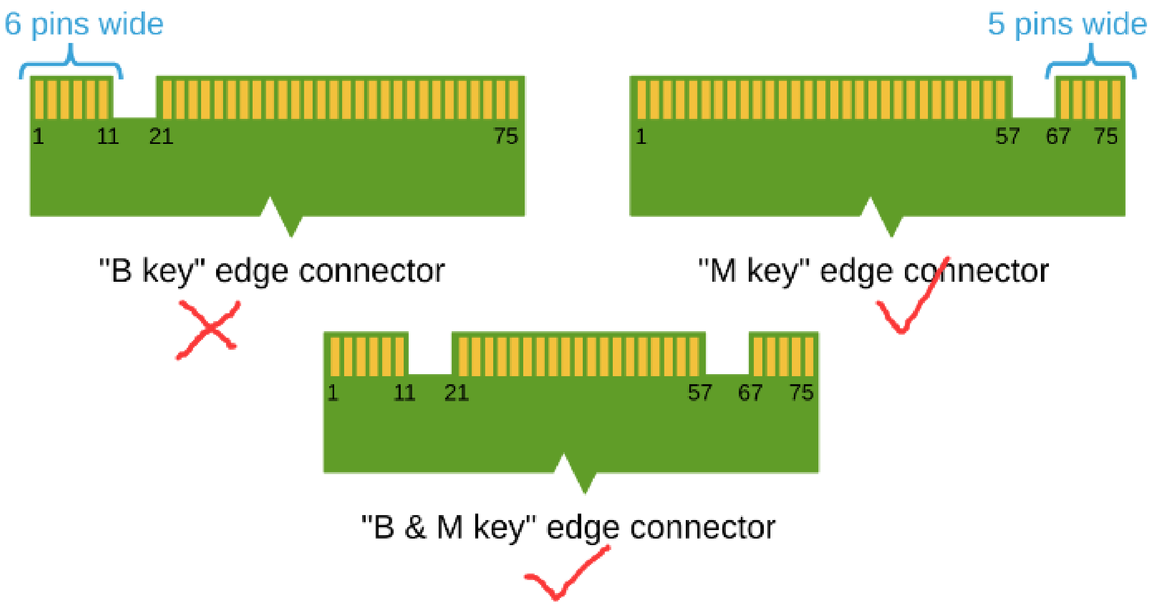
Write the system onto your own solid-state drive

1. Preparations before writing

The supplied SSD is only compatible with M.2 Key M and M.2 Key B+M interface SSDs, and is not compatible with M.2 Key B interface SSDs. The storage capacity must be at least 256GB.



The recommended size is 2280 mm (22 x 80 mm).

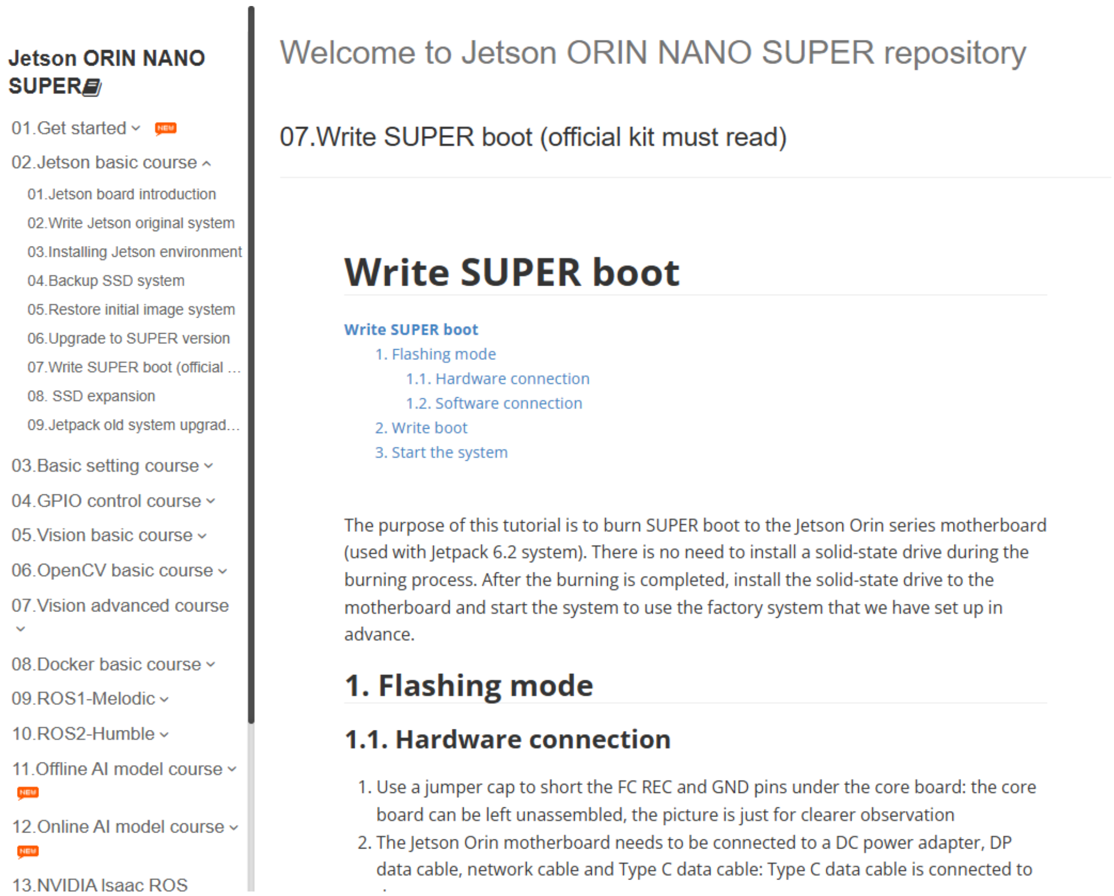
2. writing the Yaboom Factory System

Important Notes for Using the Yaboom Factory Image: For the motherboard to boot, two conditions must be met: Super Boot must be burned, and the Yabooom factory image must be flashed onto the SSD. Both are indispensable; otherwise, the system will not boot. (Must Read)

1.Write SUPER boot

Note: If you purchased the SUB version package, the Super boot is already flashed at the factory, so you do not need to flash the Super bootloader again and can skip this step.

For Write SUPER boot, please refer directly to the tutorial **【07. Flashing the SUPER Bootloader (Official Kits Must Read)】**.



2. Burning the Yaboom factory image to the solid-state drive

Before burning, install the solid-state drive into the solid-state drive enclosure.

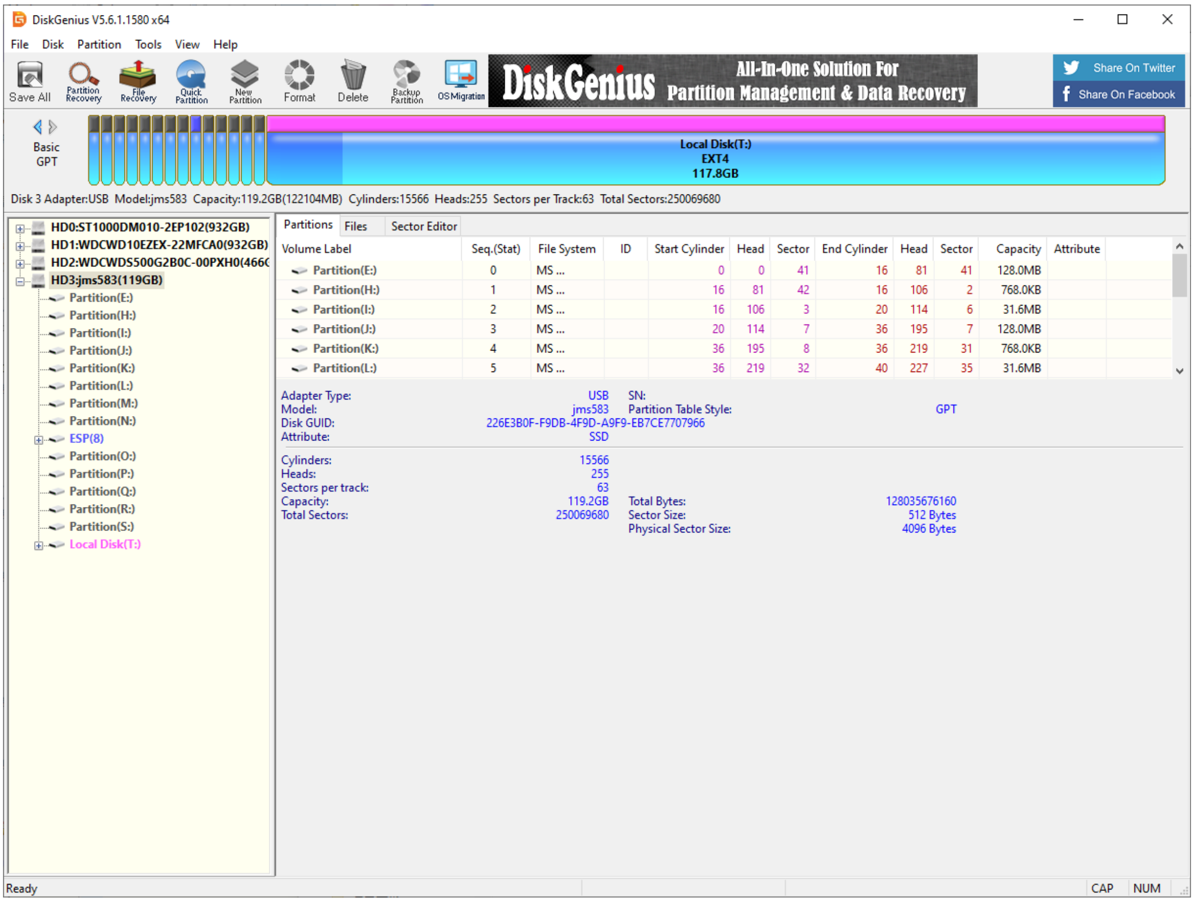
2.1. Format the SSD

Before restoring the factory image, you need to format the SSD into exFAT format.

2.1.1. Download DiskGenius

Download URL: https://www.diskgenius.com/

Double-click the exe file you just downloaded to install DiskGenius. Follow the prompts to install the software on the Windows computer. After opening the software, it will be as shown below.



2.1.2. Use DiskGenius

1, Delete partition

Deleting a partition will clear the disk data. Please confirm whether the drive letter is the disk that needs to be formatted before confirming the operation: you can judge based on the disk size and the newly added drive letter of the connected disk

2. Create a new partition

Partition the SSD into NTFS format.

Select the drive letter corresponding to the SSD, and then click New Partition:

Create ESP and MSR partition
Should ESP and/or MSR partition be created before creating new partition?
Create ESP partition
Size of ESP: 300 MB
Create MSR partition
Align to Integral Multiples of Sectors:
2048 Sector (1048576 Byte)
Remark: Microsoft Reserved Partition is used to reserve space ahead of time for other use, and it does not contain any meaningful data itself. Microsoft requires an MSR on every GPT disk, and recommends it to be created as the disk is initially partitioned. It may later automatically shrink on behalf of other partitions, for example during the conversion from basic disk to dynamic disk.
The EFI System Partition(ESP) is a partition on a data storage device that is used by machines that adhere to the Extensible Firmware Interface. It contains the boot loader programs for all operating systems installed (in other partitions) on the device, device driver files (used by the firmware at boot time) for other devices, and system utility programs that are intended to be run before an operating system is booted.
If current disk is installed on the UEFI BIOS computer or may be used under UEFI BIOS computer in the future, an ESP partition should be created.

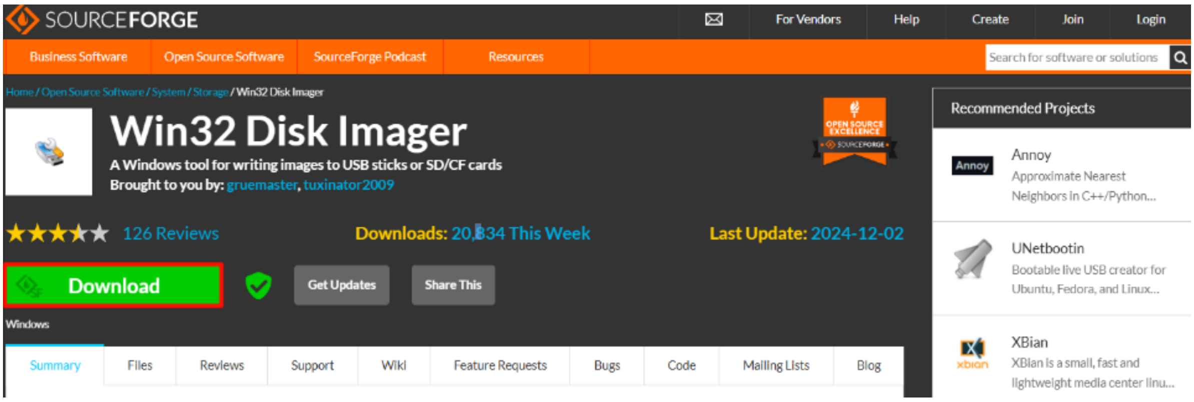
2. Restore the factory image

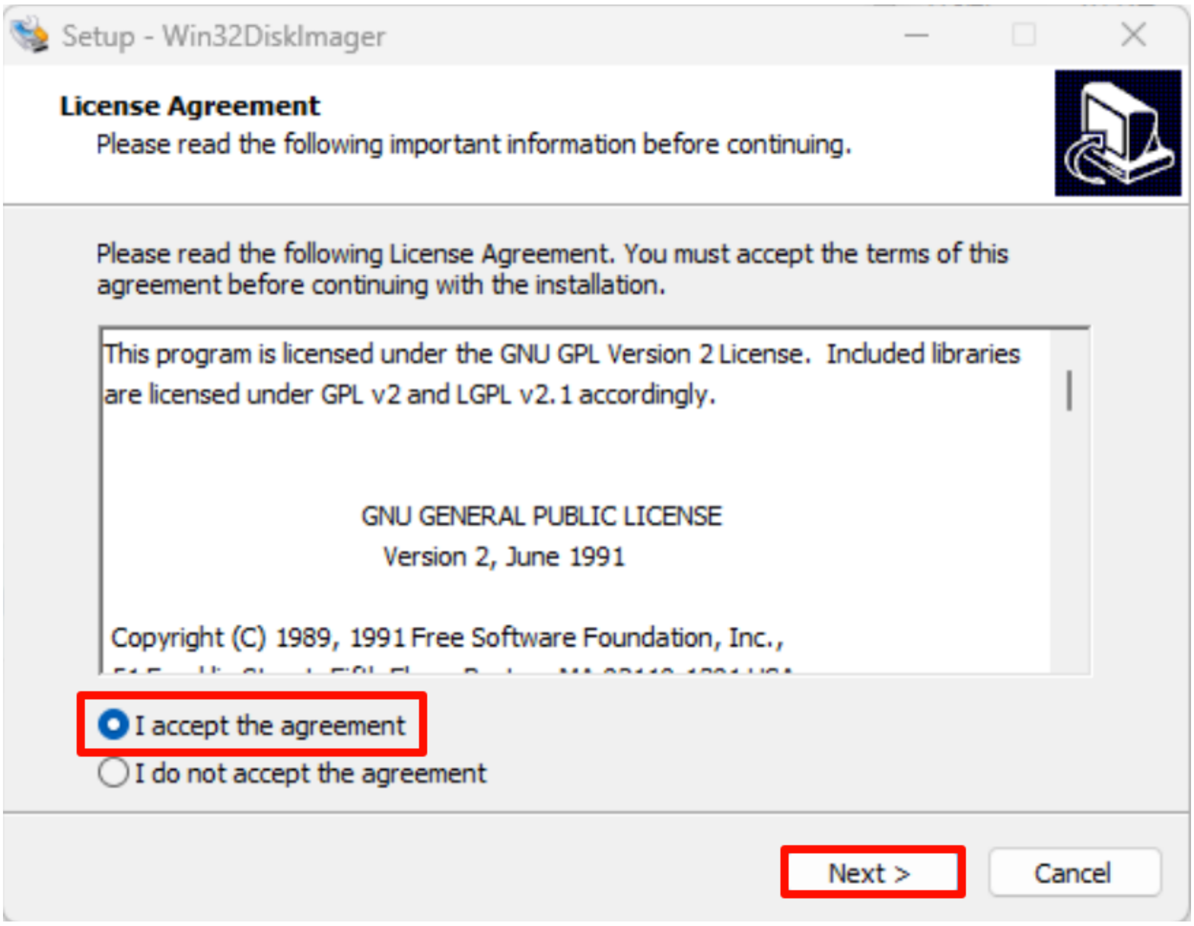
You need to download and decompress the factory image system in the data to the local computer in advance.

2.1. Install Win32DiskImager

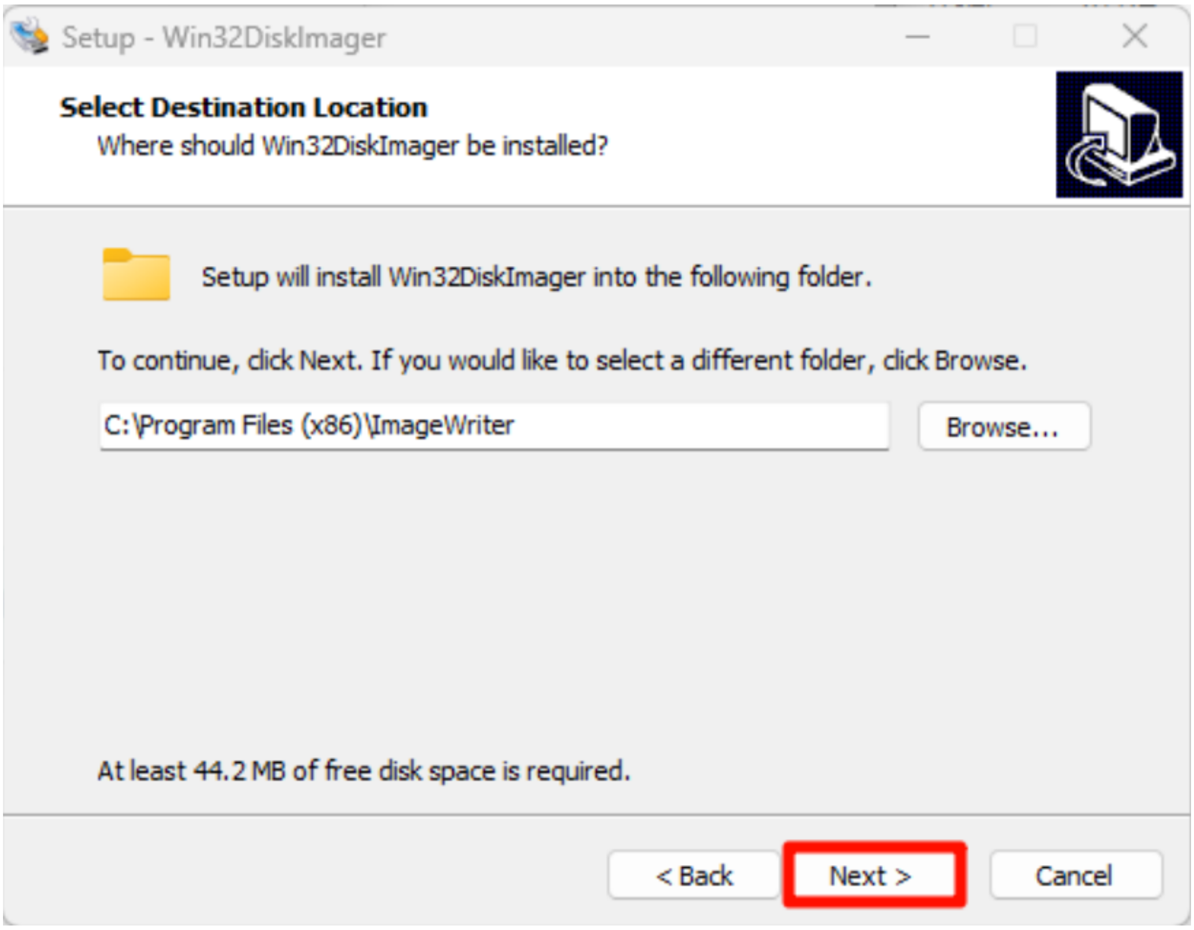
Download URL: https://sourceforge.net/projects/win32diskimager/



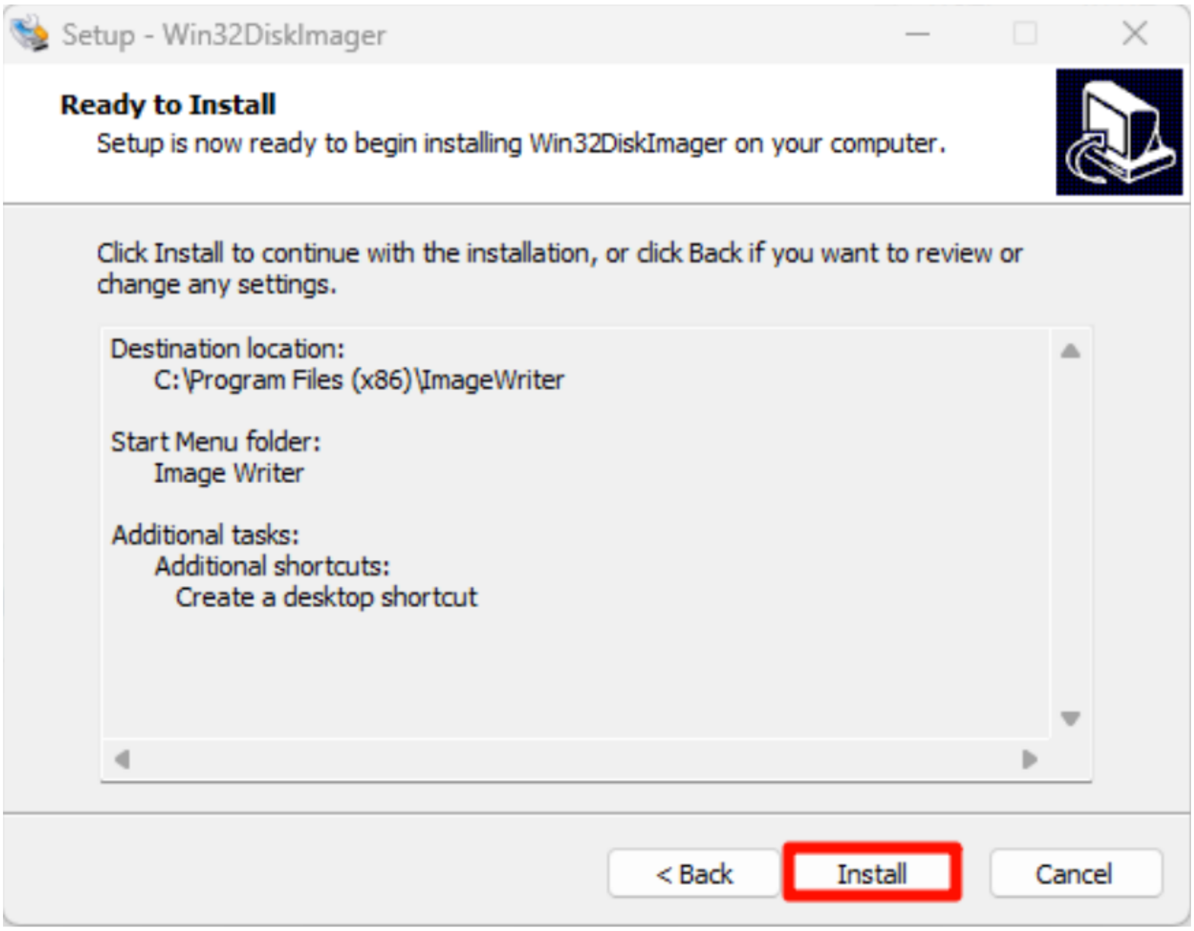
Open the `win32diskimager-1.0.0-install.exe` installation package as an administrator and accept the agreement:

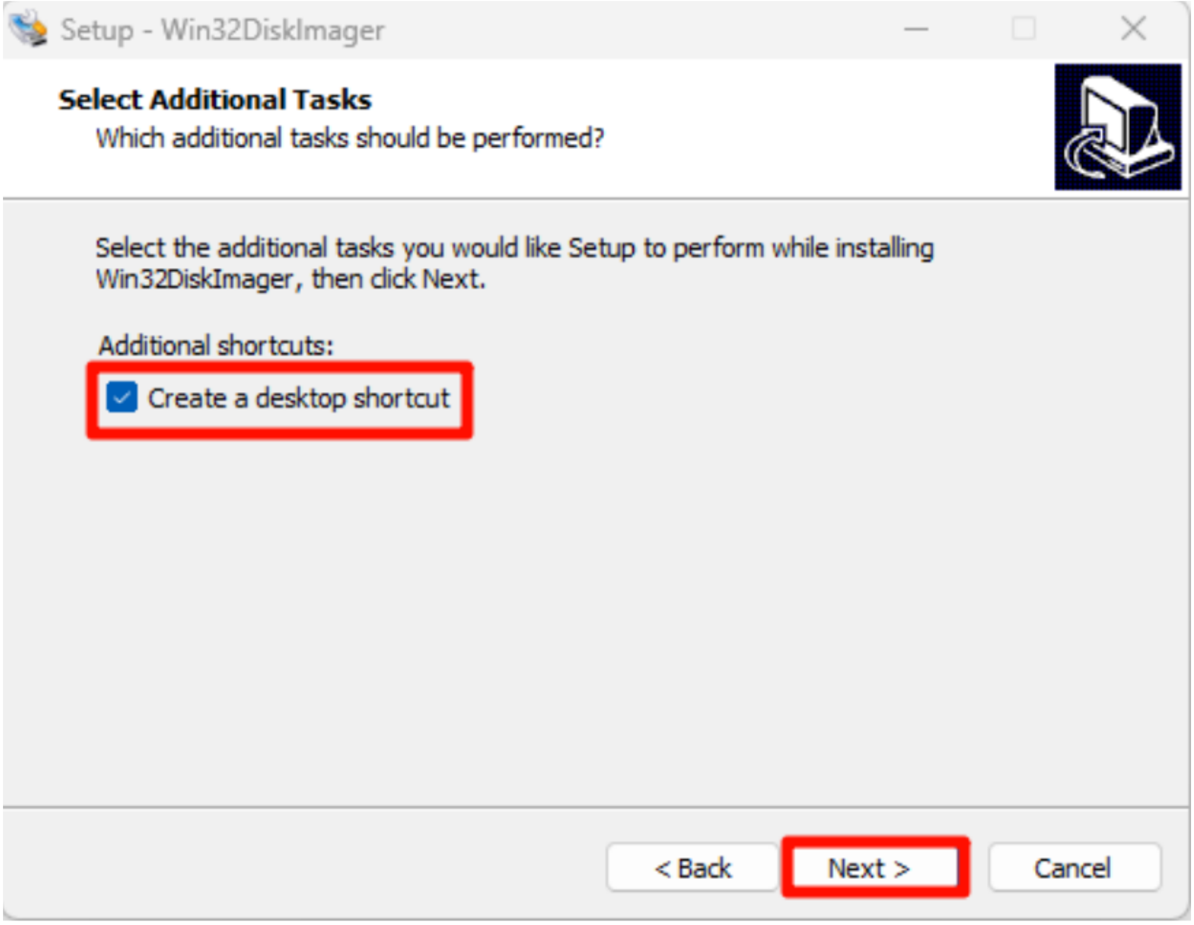


Installation location: The default location is recommended

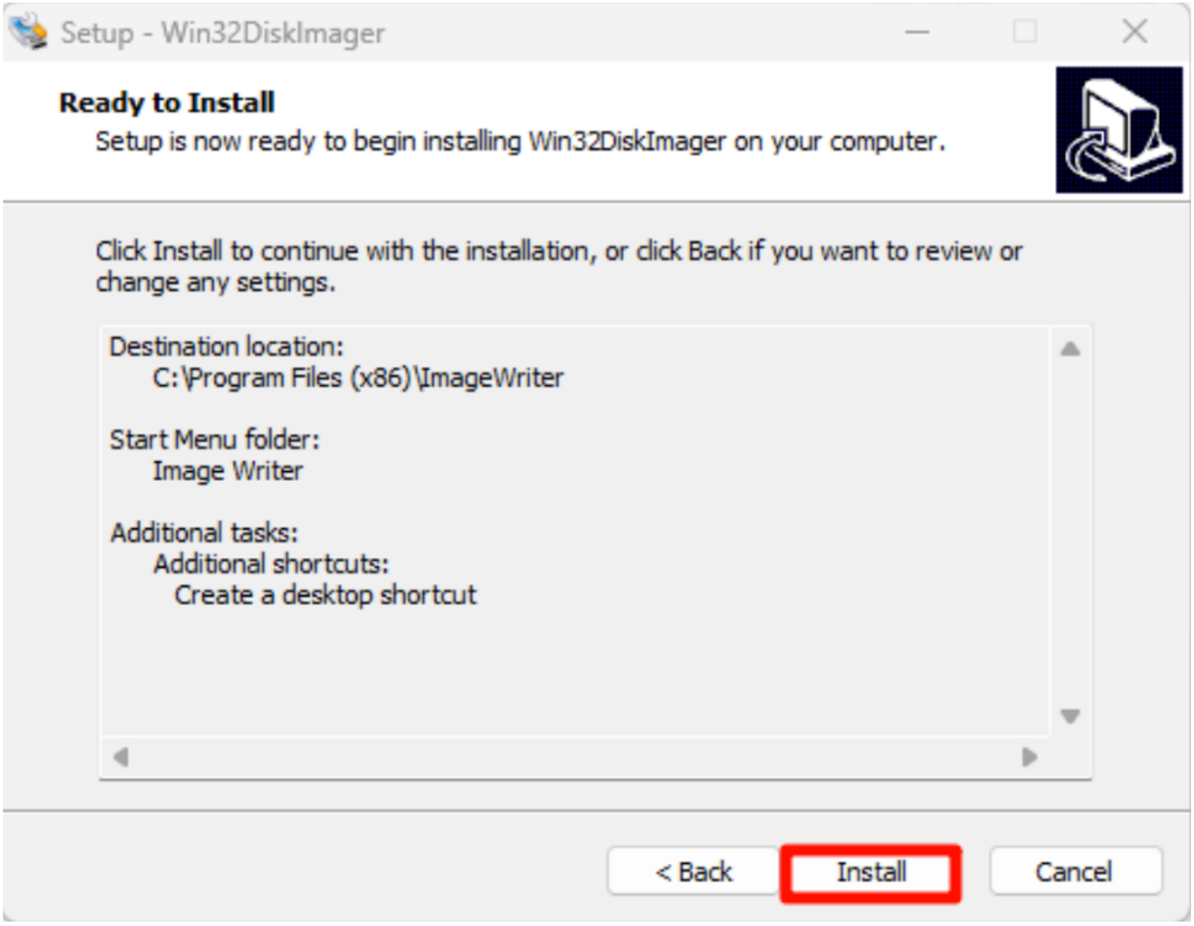


Installation options:

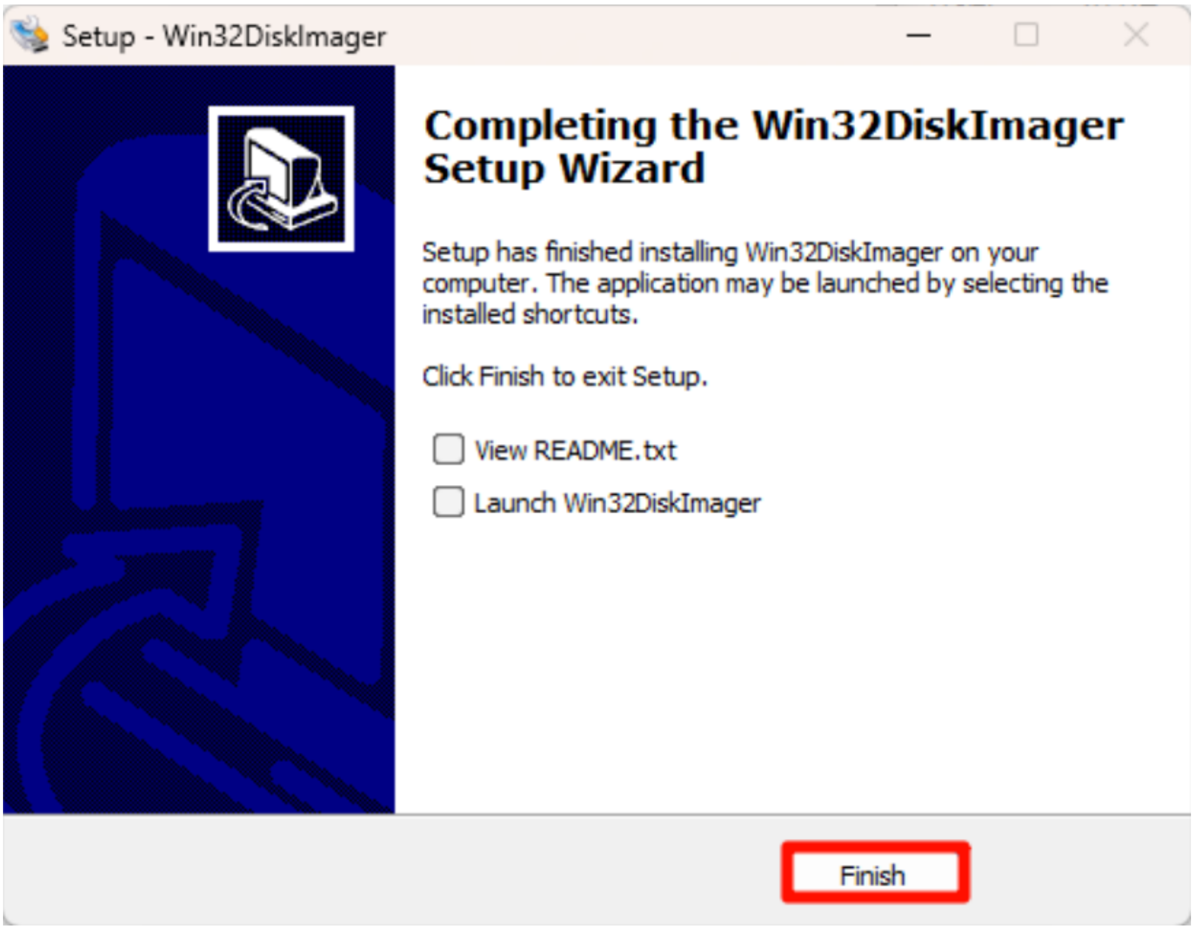




Start installation:



Complete installation:

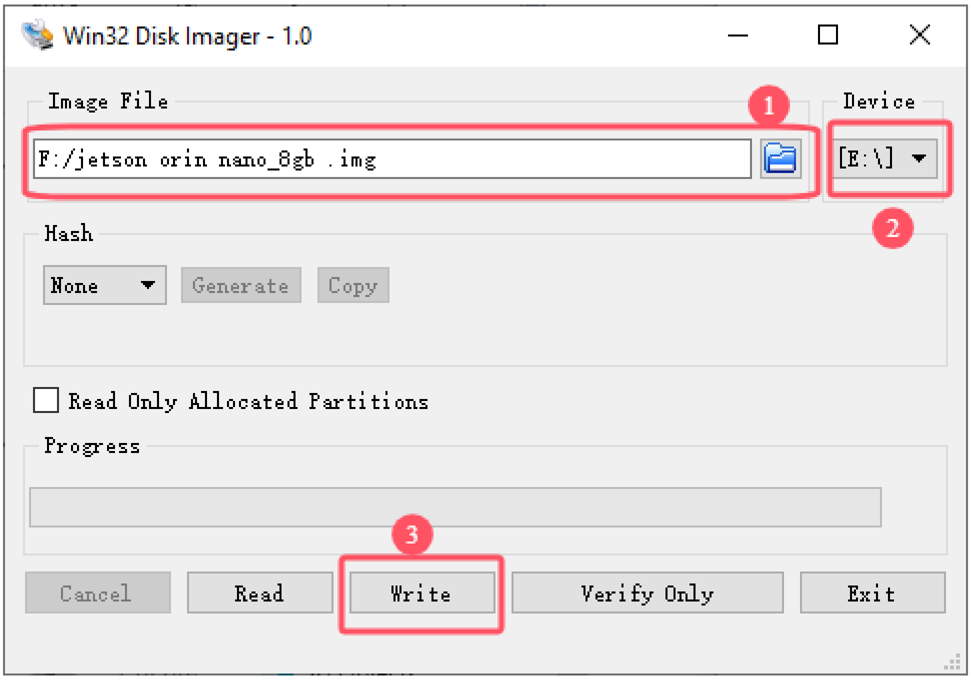


2.2. Use Win32DiskImager

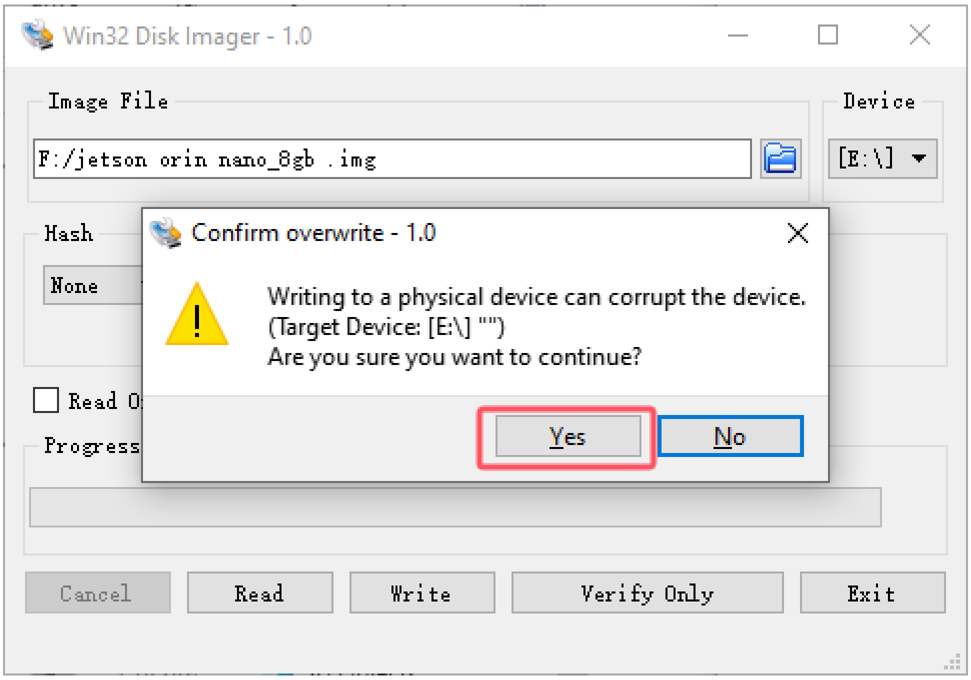
①: Select the factory image file (*.img) in the data

②: Select the drive letter corresponding to the solid-state drive

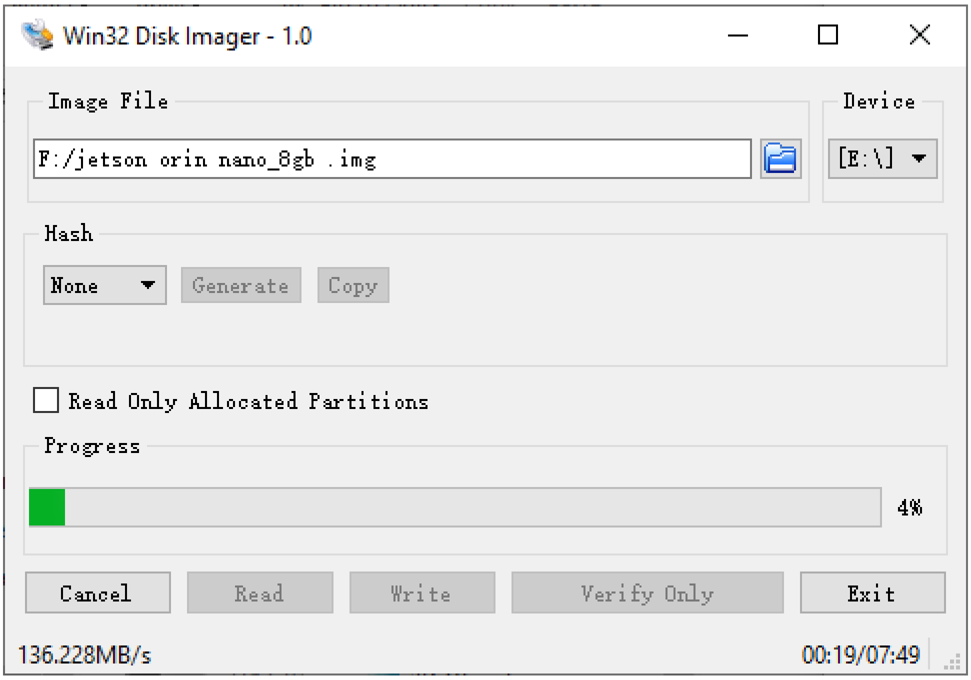
③: Write the factory image to the solid-state drive

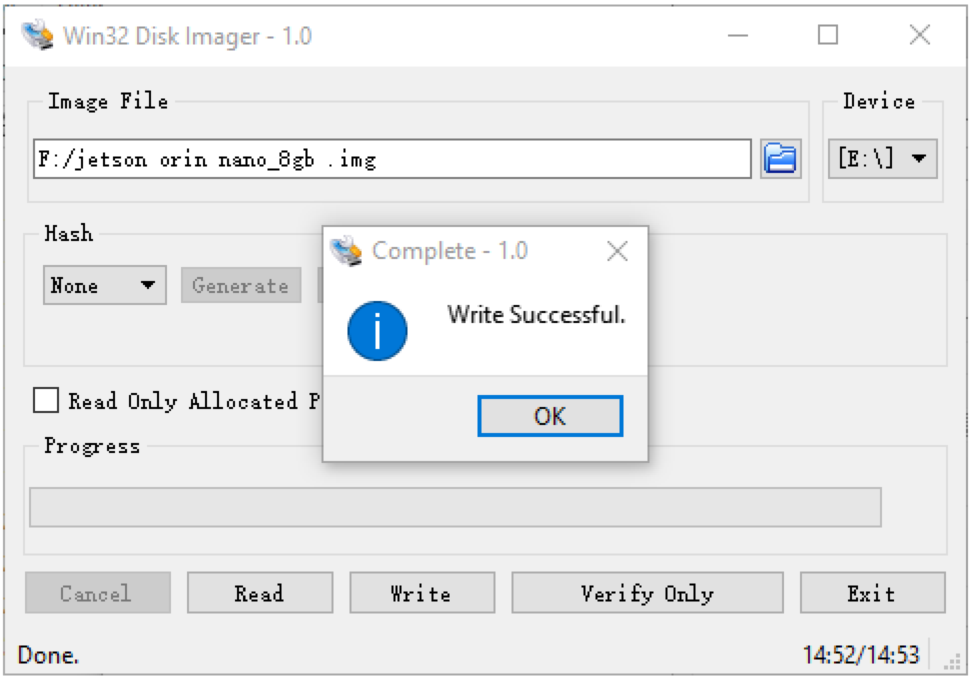


Confirm writing to the system:



Wait for the system to be written successfully:





After the system is written, you can close the program and install the SSD to the Jetson Orin motherboard!

3. Description

The Jetson motherboard can start the system normally and it depends on the system Jetpack version. Generally, only the same version can start the system!
